

What Makes the **TRAFICOP** the **BEST** Traffic Calming Cushion?

INNOVATIVE TRAFFIC CALMING SYSTEMS

The **TRAFICOP**

The original Traficop is THE tried and proven traffic calming device for safely reducing speeds and daily traffic volume. With 15 years of experience and over 25,000 successful installations, you can count on the Traficop to provide a premium, long-lasting, low-maintenance, modular speed cushion that is also emergency vehicle friendly.

Galvanized Steel Reinforcing Bars

The Traficop is the **only product installed with two galvanized steel reinforcing bars**, independently attached to the road and fitted into slots on the bottom of each module. When the Traficop is driven over, the reinforcing bars distribute the energy across all the modules, lessening the stress on the individual module and its anchors. In addition, it provides more anchor points, which keep the device where it is intended to be.

THE RESULT: *The Traficop will not push, shift or shear, avoiding costly maintenance and repair.*

Solid Modules

The Traficop is the **only modular speed cushion that is solid from top to bottom**. Others are hollowed or cored out on the bottom side and do not provide the same durability.

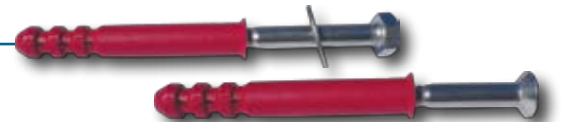

THE RESULT: *A denser, longer-lasting device.*

58 Anchor Points

Stainless steel bolts and washers, a patented RediPlug anchor system with supplied two-part epoxy and **up to 50% more anchor points**.

THE RESULT: *A more secure installation requiring less maintenance or replacement.*

Superior Materials and Bond

The Traficop is made from **recycled rubber from the tread of truck tires**. Truck tires are made from superior natural rubber and the tread is the hardest wearing part. The Traficop also uses "shards" or shredded rubber. This insures that the rubber meshes and bonds when the binder, pressure and heat are applied. The binder is a strong, premium two-part polyurethane that withstands severe UV exposure and heavy vehicle traffic.

THE RESULT: *A solid, strong and durable product that can withstand years of direct sunlight and high volumes of traffic.*
